

Automatic Indoor Insect Control Solutions for your home.

How does it work?

Pestrol has two dispensers.

The Regular Electronic Dispenser and the new Pestrol Ultra Automatic Dispenser.

The Pestrol Ultra Automatic Dispenser is fully programmable and is powered by 2 Duracell AA batteries, which will last approx 6-9 months depending on settings.

This unit releases an ultra fine amount of Pestrol into the atmosphere every 5, 10, 15 or 30 minutes, which travels through your interior by air movement.

The Pestrol Regular Electronic Dispenser automatically releases a micro amount of Pestrol into the air every 7 minutes, which travels throughout your interior by air movement. It is powered by a small 9 volt battery lasting up to 12 months or more.

Pestrol either repels insects or if they stay they die.

Each Pestrol dispenser will take care of a average home of 150 square metres. Additional Pestrol units may be required for larger dwellings or commercial locations.

Pestrol also can help disturb insects from their hiding places.

Pestrol can be used successfully with your doors and windows open.

Is it easy to use?

Simply place it on a shelf or wall bracket, push the button to set and forget. It will then send a micro mist into the atmosphere every 7 minutes. Place your Pestrol until in a central location at a height of approximately 2 metres above the floor, and at least 300mm from the ceiling. Pestrol vaporizes instantly into the air because of the ultra fine mist dispensed by the electronic head or dispenser. Pestrol molecules move through the home or work place, into the cupboards, wardrobes and behind furniture. Do not place it on white ware, furniture, or allow it to be directed onto walls or ceilings.

Performance may be affected by excessive internal air flow. If doors and windows are kept wide open and a strong through draught is created, the performance of Pestrol may be diminished.

What are the active ingredients used?

The product contains synthetic ingredients in addition to natural Pyrethrin extract.

The most important active ingredient is from a natural Pyrethrin extract. Pyrethrins are bio-degradable, ozone safe and have a long history around people, pets and food. Pyrethrins are one of nature's own protection against insects and it is extracted from Chrysanthemum daisies.

Piperonyl Butoxide are used to enhance the performance of the product.

Piperonyl Butoxide is a synergist used to enhance the power of active ingredients. It also helps reduce the amount of the main active ingredient used. It also prevents insects from breaking down pesticides.

Piperonyl Butoxide is a synergist used to enhance the power of active ingredients. It also helps reduce the amount of the main active ingredient used.

Active Ingredients are as follows:-

Natural Pyrethrin Extract 9g/kg
Piperonyl Butoxide 80g/kg
